

Fasteners of various materials

Non-ferrous metal

Properties of screws and nuts made from aluminum alloys

Non-binding information depending on manufacturer

The values in the table are for: density = 2,8 kg/dm³, coefficient of thermal expansion = $23,6 \cdot 10^{-6} \cdot K^{-1}$, modulus of elasticity = 70000 N/mm²

Material designation	Material number	Designation		Information provided by IndustriSALG	Stage of preparation of the screws/nuts ³⁾	R _{p0,2} [N / mm ²] min.	R _m [N / mm ²] min.	A ²⁾ [%] min.	Used for
		DIN 209-1 Material number	EN 28839						
Al Mg5	5019	3.3555	AL 2	–	soft work hardened	200	280–310	6	very good level of corrosion-resistance, seawater-resistant, low strength
Al Si1 Mg Mn	6082	3.2315	AL 3	–	hardened T6	250	310	7	very good level of corrosion-resistance, medium strength
Al Mg SiCu Mn	6056	–	AL 9	–	hardened T6	360	420	8	high corrosion resistance, maximum strength with good ductility
Al Mg Si	6060	–	(~AL 3)	P40	hardened T8	240	270	6	IndustriSALG connecting elements
Al Mg1 Si 0,8 Cu Mn	6013	–	–	–	hardened T8	370	400	10	still a good level of corrosion-resistance, high strength
Al Cu4 Mg Si	2017	3.1325	AL 4	–	hardened T6	290	420	6	high strength mountings but lowest level of corrosion resistance ¹⁾
Al Zn6 Cu Mg Zr	7050	3.4144	–	–	hardened T 73	400	500	6	high strength mountings but lowest level of corrosion resistance ¹⁾
Al Zn5,5 Mg Cu	7075	3.4365	AL 6	–	hardened T 73	440	510	7	high strength mountings but lowest level of corrosion resistance ¹⁾
Al Zn5,5 Mg Cu	7075	3.4364	(–)	P65	hardened T6	460	530	7	IndustriSALG connecting elements DIN 931, DIN 7985, DIN 975
			(~AL 6)	P60	hardened T 73	420	490	11	

¹⁾ Subject to stress corrosion cracking due to the high copper content

²⁾ Elongation at break A – Test on bolt with 2 x d grip length

³⁾ T6 – Solution heat-treated and artificially aged

T8 – Solution heat-treated, cold-formed, and artificially aged

T73 – Solution heat-treated and artificially overaged (artificially aged) in order to achieve the best stress corrosion resistance

Fasteners of various materials

Special materials

Designation Material number	Description and range of application, based on information provided by the manufacturer	
Hastelloy® B		
B-2	2.4617	Highly corrosion resistant nickel-molybdenum alloy with excellent resistance against reducing media, in particular against all concentrations of hydrochloric acid up to boiling point, moist chlorine water gas, sulphuric acid, phosphoric acid and alkaline solutions. Adequate resistance to oxidising and reducing gases up to 800 °C. Not recommended for strongly oxidising agents, iron and copper salts (see Hastelloy C).
B-3	2.4600	
		Application: Components subject to strong chemical action, turbo-superchargers for jet engines etc.
Hastelloy® C		
C-4	2.4610	Highly corrosion resistant nickel-chrome-molybdenum alloy with particularly high resistance against aggressive, oxidising and reducing media – bleach solutions which contain free chlorine, chlorites, hypochlorites, sulphuric acid and phosphoric acid, organic acids such as vinegar and formic acid, solutions of nitrates, sulphates and sulphites, chlorides and chlorates, chromates and cyanogen compounds.
C-22	2.4602	
C-276	2.4819	
C-2000	2.4675	
		Application: Components subject to strong chemical action, in chemical processes and plants, exhaust cleaning systems, in the production of fibres and paper, waste disposal etc.
Hastelloy® G		
G-3	2.4619	Nickel-chrome-iron alloy with excellent resistance to corrosion in oxidising media.
G-30	2.4603	Application: In chemical process engineering, particularly suitable for the production of phosphoric acid and nitric acid, desulphurization plant etc.
Inconel®		
600	2.4816	Nickel-chrome alloy with good industrial properties at high temperatures up to and above 1000 °C and an excellent resistance to oxidation. Even resists corrosion from caustic materials.
601	2.4851	
625	2.4856	
718	2.4668	
		Application: Heat treatment plant, nuclear energy technology, gas turbines, linings, ventilators and fans, chemical industry etc.
Monel®		
400	2.4360	Nickel-copper alloy with high strength and toughness over a wide range of temperatures. Excellent resistance to corrosion by salt water and a large number of acids and alkaline solutions. Also suitable for parts used in presses and forges.
K-500	2.4375	
		Application: Valves, pumps, mountings, mechanically stressed components exposed to seawater etc.
Nimonic®		
75	2.4951	The nickel-based chrome materials are alloys with a particularly high fatigue strength and resistance to oxidation. For high mechanical stresses at temperatures up to 1000 °C. A wide variety of penetration hardening methods allow relaxation and creep behaviour to be controlled.
80A	2.4952	
90	2.4969	
105	2.4634	
		Application: Rotating components subject to high temperatures, springs, fasteners, combustion chamber components, blades, washers, shafts etc.
Titanium		
Gr. 1	3.7025	Reactive material with high strength in relation to its low density. Excellent resistance to corrosion in oxidising metals which contain chloride.
Gr. 2	3.7035	
Gr. 3	3.7055	
Gr. 4	3.7065	
		Application: Components for weight-saving construction requiring high strength, subject to strong oxidising stresses, particularly in the presence of chlorides. Chemical industry, seawater desalination, power station technology, medical technology etc.
Titanium		
Gr.5	3.7164/ 3.7165	Titanium alloy with a high specific strength.
		Application: Components for the air and space industries, chemical processing technology, rotating components, fasteners, vehicle engineering etc.
Titanium		
Gr. 7	3.7235	Pure titanium alloyed with palladium. Increased resistance to corrosion, particularly against moist media which contain chloride.
Gr. 11	3.7225	
		Application: Chemical and petrochemical plant, housings etc.

! Instructions for screws made of thermoplastic materials

- Mechanical and physical properties, especially tensile strength and preload as well as colour, tolerances of threaded section and head geometry are subject to climatic conditions. Consult DIN 34810 and ISO 4759-1 for tolerance values, advice and assembly torques.
- Preload can fall via stress relaxation. Instructions for construction and design are to be followed on the basis of VDI 2544.

²⁾ Alle Werte beziehen sich auf Angaben der Rohstoffhersteller, eine Gewähr unsererseits kann deshalb nicht übernommen werden.

Diese Angaben sind als Richtwerte anzusehen. Eine konkrete Aussage kann nur anhand des jeweils vorliegenden Anwendungsfalls gemacht werden. So kann z.B. ein Präzisionsteil schon aufgrund geringfügiger Volumenänderung versagen. Andererseits können aggressive Medien bei kurzzeitigem Kontakt als Reinigungsmittel durchaus verwendet werden.

A Sehr gute chemische Beständigkeit, ständige Einwirkung des Mediums verursacht innerhalb von 30 Tagen keine Schädigung des Materials.

Das Material kann über Jahre resistent bleiben.

B Gute to bedingte chemische Beständigkeit, ständige Einwirkung des Mediums verursacht innerhalb des 7. to 30. Tages geringfügige Schädigungen, die zum part reversibel sind (Quellen, Erweichen, Nachlassen der mechanischen Festigkeit, Verfärben).

C Geringe chemische Beständigkeit, nicht für ständige Einwirkung des Mediums geeignet.

Schädigungen können sofort eintreten (Nachlassen der mechanischen Festigkeit, Deformation, Verfärbung, Risse, Auflösung).
